

Neuroscience of the reading process

Mariluz Puente Balsells

Anthropologist

Director of the Masters in Forensic Sciences and in Graphology

Universitat Autònoma de Barcelona

There is no doubt that our brains are flexible, i.e. can be moulded according to humankind's socio-cultural activities, and much has been written on this. Various tools already allow these processes to be analysed, from the simple study of patient conduct, to the actual images obtained through magnetic resonance imaging, the sophistication of the measurements of changes in electrical activity during electroencephalography, or the insertion of intracranial electrodes.

However, it is no less certain that, lately, the concept of cerebral flexibility has been harmed by the coverage of a series of false proposals, one of which, for example, is the infinite capacity of the brain. On the basis of conversations held between the journalist Gareth Cook and neuroscientist Stanislas Dehaene (*Mind & Brain*, 47) about his latest research in this field, it may be concluded that there are some restrictions that limit the brain's capacity. From a structural anthropological focus, this means that beneath the apparent cultural diversity there lie some common basic structures.

For example, the neurologist Mark Changizi proved that all writing systems share certain basic forms; those associated with natural forms and for which recognition is possible thanks to our cerebral configuration are the evidence of natural abilities, the pre-configured structures of which adapt or "recycle" in accordance with cultural necessities, evolving during the learning process with the least possible changes to the cerebral circuits, and implying that learning one skill supposes "unlearning" another.

Therefore, for example, optimising reading requires reading in parallel and at a high speed, which means minimizing our "specular vision", in contrast to dyslexics who have this capacity to detect more advanced symmetries, reading sequentially, but who at the same time have difficulties in visually recognizing the shape of letters, spatial organisation and a disorganisation in the phonological system (slow to or incapable of visually correlating the letter with its sound).

The visual area for word forms is located in the lower part of the brain's left hemisphere. This is a specific zone for written characters that belongs to a large area in unvarying visual recognition; this is, as for human faces and objects such as scenes. There is also an area for the recognition of small visual natural forms, which is also present in primates, which would deal with shapes found in nature, such as, for example, those resulting from the configuration of tree branches and which can link to letter forms, like the letter "Y", which is easily identified by primates.

The human brain is naturally formed to decipher one letter from another. It is in this way that we read, and as soon as we reach a certain fluency in this, we read in parallel and not sequentially. We rapidly break down the letters of each word in parallel, creating the illusion that we are reading the whole word, something that is unreal since our visual recognition system for letters does not detect the overall outline of words, but rather does so grapheme by grapheme. Consequently, according to Dehaene, our brain would adjust better to an educational reading method that is analytical rather than holistic (learning by words and phrases).

MASTER'S DEGREE IN EUROPEAN GRAPHOANALYSIS

January, 2012: the third edition

This professional master's programme (1750 hours **70 credits ECTS**)
is made up of three postgraduate degrees, all consisting of

-Psychological Analysis of Handwriting, Graphoanalysis, Graphopathology and Graphic Projective Tests (750 hours 30 credits ECTS)

-Graphopsychology in Domestic and Professional Settings (750 hours 30 credits ECTS)

-Forensic Handwriting Analysis, Graphistics, Document Examination and Forensic Sociolinguistics. (750 hours 30 credits ECTS)

* * *

2008-2009, studies in graphology at the Universitat Autònoma de Barcelona will conform to the Bologna agreement and will now offer ECTS credits (*European Credit Transfer System*), thus complying with the new European university-studies framework.

The heads of the programme are Francisco Viñals Carrera, Mariluz Puente Balsells and Jose Llobet Aguado. The courses will be taught by an outstanding team of academics and professionals, including experts from Spanish public-security forces and from medical and educational institutions

MASTER EUROPÉEN EN ANALYSE GRAPHOLOGIQUE

Janvier 2012 : la troisième édition

Ce Master professionnel (70 crédits ECTS : 1750 heures)
propose trois diplômes :

-Expertise en graphopsychologie, analyse graphologique, graphopathologie et tests projectifs graphiques (30 crédits ECTS : 750 heures)

-Graphopsychologue en conseil familial et professionnel (30 ECTS crédits : 750 heures)

-Expert en écriture, graphistique, documentoscopie et sociolinguistique légale (30 crédits ECTS : 750 heures)

* * *

2008-2009, les études de graphologie de l'université publique qu'est l'Université autonome de Barcelone respectent les accords de Bologne et sont devenues un Master avec des crédits ECTS (*European Credit Transfer System*), s'intégrant ainsi au nouveau cadre d'études universitaires européennes.

Les directeurs du Master sont : Francisco Viñals Carrera, Mariluz Puente Balsells et Jose Llobet Aguado, accompagnés d'une équipe de professeurs aux parcours universitaire et professionnel remarquables, parmi lesquels figurent des médecins issus des forces et corps de sécurité de l'État, d'institutions médicales et éducatives
